This study was undertaken to determine whether physiological differences exist between maternal and neonatal electrophysiological patterns. Electromyography (EMG) was performed on the mothers' right upper abdominal and back muscles at the end of the first and second minute of life,

Vault lets you choose to completely replicate the state of a VM snapshot, to just the modified state, or only to the modified part of the VM. The VM state is backed up in an encrypted format that can be restored to any number of VMs. This gives me the flexibility to perform long-term or near-term backups of VMs that do not require checking in with the organisation daily to keep my systems up to date. Reconciliation between the physical chemistry picture and the optical spectroscopy of spin polarization in reduced-dimensional systems with strong electron correlations. We present an optical spectroscopic investigation of spin polarization in a one-dimensional (1D) metal-organic system. The polarized excitation spectroscopy was performed on the site-selective site-directed molecular magnet  $\text{Ho}(\text{L})(2)(\text{NCS})(2)$  complexes ( $\text{L} = \text{acetylacetonate, acetate}$ ). In the linear optical spectra, the spin- and charge-transfer (CT) transitions remain clearly visible when the complex is in the metastable low-symmetry (LS) state. The CT

resonance is also visible in the 1D optical conductivity spectra. We have solved analytically the equations derived for the optical transitions involving the Kramers doublets split due to spin-orbit coupling (SOC). It is shown that the optical spectroscopy of spin polarization is an efficient and reliable approach to evaluate the splitting parameter  $\eta$  of the LS state.
