SMTP Diagnostics helps diagnosing problems in your outgoing email server. It simplifies testing of outgoing email server settings by letting you create and save test messages to be used later. When you receive mail at an email address of which the settings are not known, the

mail is usually rejected by the incoming mail server. When this happens, SMTP Diagnostics can be useful to check the settings in an email server and remove the settings if they are incorrect. SMTP Diagnostics is designed to help diagnose problems in your outgoing email server settings. It can be used to test settings for: - outgoing email

server settings - security settings including SMTP authentication - incoming server access and NNTP access When an SMTP Diagnostics test is run, the email being tested is sent to a personal account which does not need to be registered with the email server. The mail and the protocol messages exchanged during the test are saved in a local file, and

the test run can be repeated later using the saved mail and protocol messages. This makes it possible to view and print the protocol messages exchanged between your computer and the email server and check whether the email server rejects the email sent to a known address. SMTP Diagnostics takes advantage of Windows Server and Windows

Active Directory technologies to control when the tests are run. SMTP Diagnostics allows configuring the settings, running multiple tests, saving and loading the settings, and viewing the protocol messages. It also allows saving and loading the test email and protocol messages to the file system. You can also export the test messages to CSV files and

import them into other programs. SMTP Diagnostics helps simplify testing of email server settings by providing the following features: ⍰ Create and save test messages ⍰ View and print protocol messages ⍰ Run tests as scheduled or on demand ⍰ Export and import messages ⍰ Include file attachments ⍰ Remove test settings if they are incorrect ⍰

Run tests using the command line interface SMTP Diagnostics is compatible with Windows 2000, XP, Vista, 7, 8, and 8.1. Puredynamics is an advanced email and messaging solution for both the business and non-profit world. Its main function is sending and receiving emails. It allows senders to send emails automatically, even if the email

server settings are wrong. For instance, for email servers that send emails in spam, Puredynamics shows the details of the message, even though the message is spam. This feature allows you to determine how a particular message was mistakenly classified. Because Puredynamics is a message sending tool, it can also be used to keep your existing users

informed about important events, such as your company's new business development. In addition, this solution will allow you to design and deploy emails using various templates, and send them to your whole audience. 654 N.W.2d 810 (2002) PEOPLE of the State of Michigan, Plaintiff-Appellee, v.
