For instance, in order to have a working model on your computer, you need to have the application in a separate folder or the program folder. In other words, if you do not put the application on the root folder of your computer, it won't work! Autocad has several commands for creating a 2D drawing. The most common command is 'Insert', which allows you to create a figure or a shape. Another important command is 'Select'. The 'Select' command allows you to select objects. In the next steps, you will see how to use this command to select objects. You also need to know a bit of geometry. Geometry basically describes how you position objects on a drawing. For example, you will need to know how to align objects or how to place a line on a figure. Here are some basic tips and tricks on using Autocad: Using the Help File The first thing you should do is to go to the Help File. You can find the Help File in the tools section of the ribbon. Double click on it and select 'Help.' The Help file will appear. The Help file offers you all the help and information you will need. Receive more output from a new Command Prompt feature. When entering a command, you now have more options for displaying the results. When you run a command from the Command Prompt in AutoCAD, the return information is displayed in the area above the command bar. Previously, this area was just used for a help message. Now, the area above the command bar is used for displaying any warnings that AutoCAD detects or for displaying output from the command. The Help menu item on the Quick Access toolbar displays a pop-up window containing information for that command. When you start a command from the Command Prompt and AutoCAD detects an error, you'll receive a warning message. These messages may include information about missing files or assemblies, errors in the application, and more. You can customize how the Command Prompt displays the output from a command. The Command Prompt supports the Windows Console. When you run a command from the Command Prompt, you can display the output directly in the Command Prompt window. (Note: You'll see a check mark next to this option in the Command Prompt's Edit menu when the option is available.) You can display the output in the command line or in the Command Prompt window itself. Click the Options button to display the Command Prompt Options dialog box. Choose Show Command Output in Command Prompt window from the Show button drop-down list. Choose Show Text or Verbose Output from the Text Output option. Choose Verbose from the Verbose Output check box. Click OK. Specify another text scale as your drawing continues to open. When you zoom in or out of a drawing, your drawings will open on the scale you specified in the Preferences dialog box. You can now specify a different scale at any time when you open a drawing.
