The user then clicks "submit" and a new Array is created with the values of the TextFields, each as a string. The values from the TextFields are in a class called "SpeakerData." The textfield text contains the words within the array and it is stored in the property "speakerData" within the class "SpeakerData." I am attempting to create an array that contains each value within the property "speakerData" as a string. I created an array of type "SpeakerData" and attempted to add each member of the array into the "speakerData" array but I am getting "Could not find an overload for '+' that accepts the supplied arguments". Work directly with model makers or engineers without relying on other people to import data from their drawings into your model. Design changes to models using AutoCAD are shared instantly with the model makers or engineers, so they can take your design into their own CAD program and create a model based on the feedback. Rely on intelligent behaviors to keep models flexible, extendable, and updated automatically. The intelligent behaviors that underpin the modeling paradigm — actions, triggers, and behaviors — are unique to every user or business process. For example, the workflow of a mechanical engineer and a designer will have different needs, and intelligent behaviors such as "Always keep the model current" and "Reset automatically if data changes" will address those specific needs. Use model templates to automatically create models using predefined templates. Create a large number of standard, ready-to-use models for use in business processes or for sharing with other people or software programs. Design features: Extend the design of your model based on the data in the source drawings, and share your designs with other people. To create and refine your design, you can use CAD-like interactions such as a zoom-in, zoom-out, or rotate-in-place on a 3D model, or annotations and text on a 2D image. Track your design while it's in development. Use design reviews, comment threads, and parametric tables to keep your designs current and unified. Use the ARX tool bar for creating new toolbars, adding new commands, or modifying existing commands. In addition to modifying an existing toolbar, you can also add commands or buttons to a toolbar. The Advanced Drawing Tools dialog box allows you to easily control what's displayed on the screen, as well as to customize it. It contains a variety of controls that include toggle switches, combo boxes, button groups, and text boxes. It includes many features, including the ability to create and manage toggles and combo boxes, adding and removing buttons from button groups, and setting and accessing the information in the text boxes. The list below provides some of the key features of the Advanced Drawing Tools dialog box. Simplify workflows for new users with a user-defined keyboard shortcut or an on-screen toolbar. For existing users, you can use the new Options window to configure the shortcut keys or toolbar to suit your work style. The Modeling Extensions dialog box, part of the editing feature, provides advanced user features for
