Find missing files by sorting them (alphabetically) or by specifying the required name, extension, timestamp, size, folders, and IP address. The program will show the positions of the missing parts of the file on a map, the list of the involved.Aspects of the invention relate generally to communications, and more particularly to techniques for providing an information service in a computer communication environment. A problem with many information services is that the services are generally data-centric, i.e., the content of the service is delivered in a particular way. This may lead to some information being more suitable for some people than for others, and may not be relevant to a person when they are interested in the information. Some current web-based services, such as a music service, may allow a user to browse the library of music and view a variety of

service offerings for each song. Unfortunately, the user may find only limited use for this information if, for example, the user does not like the music. Additionally, the services are generally not focused on what the user wants, but rather on what the service provider thinks the user wants. Additionally, the user may find only a limited use for most of the information if the user does not like the music. Moreover, because the services are user-centric, the user is driven to interact with the service. Further, the user may have only a limited ability to offer their own feedback to the information service. Even with music services, where the user can listen to songs of the user's choice, it is very difficult for the user to offer feedback about what the user would like to listen to. Additionally, the user may find only a limited use for most of the information if the user does not like the music. There are some web-based services that are not focused on information, but rather on purchasing products on the Internet. Such

services have the goal of getting the user to interact with a service, so that the user will be convinced to purchase items through the service. Unfortunately, these services do not provide a service to individuals, but rather a sales service. Such a service is not acceptable for an information service where the user wants to simply view the information. Further, current information services are often very limited, as they are only applicable to a particular subject. Additionally, the information may be available for a limited time (e.g., articles, sounds, news, etc.). Moreover, the content of many of such services is often poorly managed and updated.Patchen c6a93da74d
