We collect and publish everything here for you.Q: Is there a workaround for OpenID authentication on MVC 4 if OpenID provider has a max ID length of 65,535? As stated in this blog article, Microsoft has published an OpenID provider for use with the new ASP.NET MVC 4 authentication mechanism. It includes a number of samples for OpenID and good integration into an existing ASP.NET MVC 3 project. As stated in this MSDN article, the provider supports the OAuth 2.0 protocol extension for the scope parameter in the URI. The URI should be in the form of: Where o8 is the OpenID Provider domain name. This may not be an ideal choice for an OpenID Provider because Google does not use a max ID length as stated in this blog

article. I'm trying to better understand how to use the Microsoft OpenID for applications where I need to support the Google provider. My questions are: Is there any way to work around OpenID provider having a max ID length of 65,535? If not, I'm confused about how this would work for me since the max ID length is not the same as the Allow c6a93da74d
