Given a random variable X and a new random variable Y independent from X and $\mathbb{P}(Y = X) = \frac{1}{2}$ $\mathbb{P}(Y = -X) = \frac{1}{2}$ We are asked to find the marginal distribution of Y . My problem is that I don't know if it is $\mathbb{P}(Y = \{x: x = \pm y\})$. I've tried to do this by using a Markov Chain but it's not working. A: HINT: $Y \perp X$ (independent), so $\mathbb{P}(Y \in A, X \in B) = \mathbb{P}(Y \in A) \mathbb{P}(X \in B) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$ Q: How to get a function with capture group to take more than one value? Hi I have the following function to return the country code of a user based on their IP address: `function ip2country($ip){ return explode('.',$_SERVER['REMOTE_ADDR'])[0]. '.'. explode('.',$_SERVER['REMOTE_ADDR'])[1]; }` I was wondering how I can get the function to take 2 or more values? E.g. I want to be able to get the country code if the IP address is 123.456.789.012. A: If it's always two, and always numeric, you can use regular expressions: `preg_match('/([0-9]{1,3})\.([0-9]{1,3})/', $ip, $matches);` Use the second capture group, `$mat` `ff5e5ca8c9`
