Stimulating effect of gastrin on human gastric mucin release in vitro. The effect of gastrin on mucin release from human gastric mucosa was studied in vitro using the Ussing chamber technique. The release of endogenous gastric mucin from the isolated gastric tissue was determined by measuring the amount of radioactivity recovered from the incubation medium after an in vitro pretreatment with various test agents. Gastrin, heparin and synthetic pentagastrin produced concentration-dependent increases in mucin release. Mucin release in the presence of gastrin was increased about five-fold by 30 mM bicarbonate and three-fold by the ionophore A 23187. Mucin release in the presence of heparin was increased about two-fold by 100 microM and three-fold by 10 mM and 30 mM bicarbonate. Mucin release in the presence of synthetic gastrin was increased by all doses of bicarbonate tested, and by the highest concentration of heparin used. The data suggest that both endogenous gastrin and exogenous gastrin-releasing agents may regulate mucin secretion by stimulating the release of mucin from the gastric glands.<sup>5</sup>.
