What's New in the Bandwidth Meter And Diagnostics?

Measure bandwidth, speed and block packets. The average is calculated as follows: Speed:the number of packets sent within a given time period Bandwidth:the average number of bytes sent per second. The average is calculated in TCP/IP mode, that means packets smaller than 2345 bytes are not taken into account. Bandwidth:the average number of packets received per second Worst bandwidth:the number of packets the sender/receiver sent at the lowest bandwidth. Worst bandwidth:the number of packets the sender/receiver received at the lowest bandwidth. Receiving speed:the number of packets received within a given time period. The information about the network connection is cached, so the information is immediately visible in the notification area. The notification area is also cleared if the connection is restored. If Internet connection fails to connect, the plugin notifies the users about the failure. You can configure Firefox to not alert for failed connections. With a click, the connection status is saved to the history. Download link:1.1.1:
