So you can use a CSS class for styling your text area: .mainTextArea { background-color: #666; -fx-background-color: #666; } The effect of cement and repair modulus on the mechanical properties of a freeze-killed bovine pericardium patch in a vertebral body augmentation model. In vertebral body augmentation, the pericardial patch is a standard tissue substitute. Its stiffness can be altered by the application of a bone cement or by a change in the material properties of the patch itself. In this study, the mechanical properties of the pericardium were assessed at different time intervals and by either use of cement or by altering the material properties of the patch itself. A freeze-killed (cryo-killed) bovine pericardium patch was prepared with a prescribed modulus and subjected to controlled tension to measure the mechanical properties and stability of the patch in different conditions. In all conditions, the elastic modulus and tensile strength of the patch were approximately one-third that of intact bovine pericardium. The freeze-killed patch did not undergo mechanical failure as would be expected for a traditional collagen-based tissue. A fixation of the patch to the bone was not observed at all time intervals
