Adobe portraits continues to evolve. I'm happy that ACR's SRW (Smart Preview) update has arrived. I found new contrast and exposure options, a Live histogram, a more detailed waveform view, a countdown of remaining time to image capture, and lots of other great features. The Thumbnail Preview pane has been redesigned and now includes a realtime exposure value, which is much more useful in the Thumbnail view than the older Exposure Channel view. I was hoping to see another addition to the ACR system, but I think that a new version of the popular Nik Collection module will take care of most defects. Until a special effect is shown in its full glory in the Thumbnail View, I will never be certain if a particular effect will look good or not. Say what you will about the rest of Adobe's stuff, but when it comes to cameras, it's first-class. I actually use Nikon for shooting, but the same rules apply here as they do with every other tool, regardless of manufacturer. I understand that Black Magic effects look sexy and can be used professionally by creatives and professionals. But I would prefer if a photographer's livelihood didn't ride on the photography editor of a magazine or art director of a retouching studio. What makes Adobe's work even more peculiar is the selection of color. Through digicam, the GIMP is so flexible you'll never want to go back to Photoshop. The tone curve features of ACR are unique, yet in my experience, they don't offer more options than the original version of Photoshop. I'm really impressed that ACR is stable for video editing.
