Database Creating and managing a database is vital to any application. While MySQL is often the database of choice, developers may also have the need to create and manage their own databases, which sometimes requires a little more knowledge and understanding. In this tutorial we will learn how

to create a database, add tables, create indexes, create foreign keys and much more. What is a database? A database is a collection of information organized in a table, which is then stored on a physical or logical server. How a database works A database can be viewed as a collection of information stored in

tables, which are divided into named fields or columns. A table contains rows of information that are organized into rows and columns. Creating a database A database must be created before any tables, 2edc1e01e8
