KEYMACRO is a virtual keyboard that can access and change your keyboard's macro functionality, allowing you to quickly input special commands or text. The program doesn't require any previous installation and you can get started in a few clicks, with minimal configuration. For example, you can give it a custom name, layout, input, and output. At the same time, you can configure how often you would like the keyboard to record macros,

and set up keystroke-to-object, text-to-command, and object-to-command associations. Another useful feature is the capability to assign keys to functions such as Cut, Copy, Paste, and Undo, while also giving access to macros for the browser, file manager, calculator, and more.

Moreover, if your computer is stolen, you can remotely protect your data and prevent further access to your computer with special password.

This lets you manage your keyboard using your account, or by setting up a "non-repudiable" encryption code,

using a 4-digit password. Evaluation and conclusion KEYMACRO had no errors and the software utility worked without any glitches. The set-up wizard made it a cinch to create macros in seconds, and the utility ran quietly and was not too resource intensive. Apart from the missing KeyShadow, which we described in our review of the similar software, our tests suggest that this is a robust keyboard manager with lots of useful features.

The component.getBounds() method will return the new location (after the move). You should also override componentMovedTo() for the new location, as the old location (before the move) can be relevant for some purposes. When you're able to get on with people, it's a relief."
