Any further questions, please contact us. Log in Home Welcome to the Second Annual Prolog a Journal of Computing. We would like to introduce this page to you as a means of communicating with us and our readers in the event you have a specific question or comment. All comments can be sent through the contact page.[Prevalence of leprosy in the Northeast of Brazil: analysis of data of 11 years]. Leprosy, a neglected disease, still affects millions of people and shows an increasing trend in number of cases in the world. In the Northeast of Brazil, from 1981 to 1991, there were 270,644 new cases of leprosy detected by all the health services, which means a real increase of 3.6% in the endemic region. The purpose of this study was to investigate the factors associated with the incidence and prevalence of leprosy in the Northeast of Brazil, taking into account the sociodemographic characteristics and to quantify these characteristics. The results revealed a significantly high incidence in male and aged people. The most important associated factors were sex, age and living areas. The annual prevalence of leprosy in the endemic region was estimated to be 19.6/10,000 inhabitants. The associated factors were sex and the age group. The high prevalence in males and in the aged could be due to the greater social exposure of these groups, while the increase in new cases from the endemic region in 1991, with a higher incidence in males, could be explained by the higher number of cases detected by the programs of DOTS. Experimental chemotherapy with fluoropyrimidines for the treatment of human cancer. Many types of cancer fail to respond to currently available therapies, leaving patients with no curative options. In this review, we summarize the current status of chemotherapy with fluoropyrimidines as antineopl
