the framework separately. Working with the native controls is preferred due to better performance. But if you want to use custom controls, you can follow the following instructions to accomplish your requirement. You can easily install the Studio on your development

machine using the links below. However, please do note that this is a software package and you'll need an access to the Internet in order to install it. The Control properties are exposed in the ControlTemplate type, and in this case, you will have to edit the XAML files and set the access to the Style

setters for each property. In order to add any custom control, the first step is to create a new class that inherits from the UserControl class. You will also have to add the following code in order to bind the Properties of the Control to the view model. Before you start using the controls, make

sure that you have installed the Visual Studio 2013 SDK as well as the Silverlight 5 SDK. Now you can start using the Studio for Silverlight. The Studio is divided into three sections as shown in the figure below: The interface section that is displayed as a ribbon includes the open, save,

new and close icons. It is the entry point for developers who want to start using the controls. The property explorer that is displayed as a panel contains the properties of the controls. It is an IDE component which allows you to interact with the properties of the controls as well as view

them on the designer surface. The Designer that contains the design surface for all the controls. It helps in the design of the UI by providing drag and drop features as well as the standard features like resizing and zooming
