"The Outfit" was a personal assignment for me. I wanted to create a unique outfit from a simple selvedge denim shirt and blue jeans. After I finished, I immediately realized that the original attire has a really mundane appearance as having all the denim on the front. After a visual discovery session, we decided that a layer should be created on top of the natural color of the denim." My first reaction was doubt. How could a prosumer's camera (T6s) achieve such fast and sharp photos? The reality is that the camera's 8-bit VSX processor is much more powerful than a typical DSLR, and this processing power is reflected not only in the more powerful image stabilization, but also the fact that specific processing tasks are performed more efficiently. The maximum bit depth of the camera (12 bits) has a big advantage too. This extra bit depth allows you to create significantly more advanced editing operations and adjustments, which yields stunning results. I now elaborated on this ability to deliver "pro" quality images from a prosumer camera. "The image quality is just amazing from the first time we used it in the example.
