Sleeve extension connectors typically comprise a sleeve having a terminal engaging portion and a coupling element adapted to connect with the electronic device. The terminal engaging portion is formed as an assembly including several individual terminals, or simply as a single terminal. The terminal engaging portion is typically connected to a terminal connection portion of the sleeve. The terminal connection portion of the sleeve is typically crimped or soldered to a rigid material of the electronic device or to a flexible printed circuit cable. Sleeve extension connectors are used to connect extension cables to devices having both a terminal connection portion on which the connector can be installed and a device to be connected. This structure is used, for example, to connect extension cables to a computer, a printer or a camera. Sleeve extension connectors are available in a variety of different types of cable with the terminal engaging portion of the sleeve connector being compatible with the cable. One particular type of cable is known as Unjacketed, which is a type of connector and cable design that does not require any tools for installation and removal. A Unjacketed cable is well suited for use with a variety of different connectors, such as modular jacks, RCA jacks, UTP, or CATV coax cable or RS-232 connectors. It would be desirable to provide sleeve extension connectors having a terminal engaging portion that can be connected to a variety of different cables.
