Elements can import TIFF files and edit them without losing image quality, which is nice for printing, but where's the option to sRGB? Photoshop allows you to import files in sRGB color space, and then to convert them to Adobe RGB. Elements doesn't do this. Another apt-to-pointless bit of non-sRGB functionality is that Elements doesn't let you access RAW Adobe DNG files from Garmin cameras. And an important shot of my portfolio goes to Photoshop. When it comes to saving files in the cloud—and a lot of us are doing that—Elements is in a league all its own. You don't need a signed-up membership to download files to your computer. If you have an account at Adobe Share, you use it to save files in the cloud. It won't let you edit them, but it gives you an estimated value for images before you save them, so you can check them in or out on your own terms. There's a reason that Adobe declined to offer the feature that makes this app very cool: The hardware. Being able to edit files directly on the tablet makes a lot of sense on paper. Watch: Google Docs is built for mobile, and it works pretty well. The Adobe Photoshop can be a powerful tool, and if you need to push it to be more powerful, you might soon use the iPad Pro and the entire Adobe Creative Cloud app lineup for serious image-editing. First, you must manually import the files you want to edit into your project before you start editing. This is a pain that could've been avoided had Creative Cloud shared its saved files with other users the way Google does. Where Google Docs can instantly open your files, spot mistakes, and apply changes, your files are more like links to the file they represent, rather than the files themselves.

The power and performance of Photoshop come from a combination of an industry leading UI framework, custom hardware accelerators, and memory management. By shipping a true graphics API, we've been able to parallelize many of the processing tasks in Photoshop's core UI framework - such as filters, effects, and rendering - including all the image processing in Photoshop. This has also freed up memory by reducing the amount of shared memory allocated for layers and filters. In fact, shared memory usage has been around 2GB in the past. This is great performance-wise, but it is not scalable for future needs. With the new GPU API that was announced today, we can now power Photoshop with GPU-based cores

and make it faster than ever before. And we're continuing to invest in making this API a first choice, by making it the default for future updates as they come out. This new GPU API is just one example of the many areas where we are working to accelerate and optimize Photoshop. We've also extended our partnership with OpenCL and AI by complementing OpenCL with our native GPU APIs in both MacOS and Windows, and making it easier to use AI standards throughout. We are also working to experiment with both AI and OpenCL in the new iOS and macOS, and in future releases.
