One of the main features of the application is that it does not just display data, but also allows you to interact with the application while it's running. This way, you can directly apply any changes you make in the IDE, for example, compare three times and see the performance results. This, along with easy navigation between various areas, makes sure that you spend less time developing and more on enhancing it. This video shows you how to install and use Adobe Scout CC for AIR, ActionScript, Flash and AIR application development. After installing the application, navigate through the various panels to discover the system-level metrics, CPU usage, timeline view and more. More importantly, with real-time sequence analysis you can monitor the changes in the application. Choose to display different parts of the application, from a timeline or the frame itself, and then view the data in the appropriate panel. Learn how to get the most out of Adobe Scout CC and start developing your next app! Adobe Scout Features: Strictly dedicated to Flash, AIR and ActionScript development; Step-by-step sequence analysis to view changes to the application while it's running; CPU usage tracking to monitor application and the overall system performance; Reduces time spent on optimizing the application; Graphical interface that is easy to use and navigate; Intuitive interface that allows you to view and use the application with minimal training; Display of frames from the timeline view; Display of recorded frames; Full support for Flash development languages. To ensure that patients are appropriately monitored in their homes, it is important to know whether a given home monitoring device generates a valid signal. This study examines the performance of nine home monitoring devices currently being used in Canada and compares them with the manufacturer's recommendations for their validity of output. Sensitivity and specificity calculations were used to determine the validity of output generated by the devices studied. Devices that were considered to generate a valid signal were then tested for reliability (agreement of device readings with a gold standard). The validity of output from nine home monitoring devices was tested using data collected in three European studies. All but one device correctly detected all episodes of activity, and most correctly detected resting episodes. The validity of output from five devices was insufficient and would not prevent appropriate alarms to be generated if used. Only one device had 100% sensitivity and specificity when tested in a non-European population. The poor performance of many home monitoring devices highlights the need for more research on their validity of output, as well as on their reliability of output. Further research is needed to determine whether the specific issues identified in this study with some of the devices are associated with specific disease states or user characteristics.Slashdot videos: Now with more Slashdot!
