The fact that the new Bracketing is almost identical to the one that recently received the most acclaim in the Lightroom mobile app is, to me at least, a bad sign. The current Photoshop version, Version CS6, continues to offer functionality updates, but the bulk of the changes are under the hood. The workflow has been completely revised, for example, so it's much easier to work on a big file from start to finish. The software's been updated to work natively with the new iCloud features. Designing images with a lot of possible paths can be a real headache, and previously Photoshop required a lot of clicks and workarounds to get various image layers to blend together and look natural. Now there's a fast-acting **alpha mask** tool that even lets you mask elements of an image as a series of paths, making large-scale changes and gathering a whole bunch of elements to work on at once. There's also a **lasso** tool that makes selections (and optionally allows you to feather them) with a single sweep, even on the fly, and an easier way to draw **paths** directly in the workspace.
