It should be noted that Adobe is pushing a lot of smaller improvements in various areas. They are still impressive and some of them still have me excited, even after many months of working with Photoshop CS6 beta. For example, the new interface makes it easier to access Photoshop's built-in tools. Before, I had to open each tool panel twice just to get it. Now, simply opening it once with the Big Panels button creates a panel with all the tools and buttons under it in one swoop. It's faster and I prefer it. I can also now click on a tool button to get less than the full blown tool. (I am not sure yet if this feature will be turned on by default or not.) Tooltips are also improved, and the tolerance has been moved back to the top left corner. With the "Warp Slider" tool, for example, a new "Tolerance" button is now located under the "Options" button so more than one can be selected at a time. I find that I use those buttons less than ever, and I am glad to see them back. Additionally, Photoshop is still packed with numerous amazing tools to deal with just about any special needs editing. It continues to include some of the most advanced and flexible ways to edit images with a variety of unique tools from painting and filter effects to healing and masking. With layers, I find that I do not need to use the Save button as I did in the past. I can crop on a single layer, see the preview, and save; it works nearly as well as a single click save functionality. Perhaps the biggest changes are on the frontend for working with a connected clipboard. You can now paste from up to four different places: within the same view, a note, a linked reference, a web site, or any other location you wish. You can edit this information and then paste it into the same image at a later time. I think this is a big step forward for my Photoshop editing workflow. Photos that need to be shared can be edited at any time, and I can email or print selected images with a click of a button.

There are a number of ways to remove the unwanted background from the image, with the eraser tool often being one of the most popular, but there are a few things to consider when using it. Obviously, the main thing to consider when using an eraser is the background surrounding the subject you are erasing. If you want to remove a background contained within the eraser, the eraser will not cut out the foreground subject. You will have to select the area of the image containing both the foreground and the background you want to erase, and then click and drag to get the eraser to remove the background. If you want to remove a background outside the area of the eraser, you will need to indicate where you want to cut out the background. You can do this by selecting the area of your picture that you want to use as the location of the cut out, and then drawing a box around it with the eraser. Now that you have the box the size of the background, click the eraser to cut out the background. e3d0a04c9c
