I now want to create a script that copies the metadata from one .mp4 to another. However, my programming skills are very limited and I can't even find a library (with documentation that I understand) to even start the project. I think ffmpeg can do the trick, although I'm not sure. After importing files, you can find all imported files in My Album. Now, drag and drop MP4 files you like to merge to the video track on the timeline. All MP4 files will be played one after another automatically. The car retired only four times in the season - with Prost retiring at Silverstone during a very wet British Grand Prix (handling), and at Monza for the Italian Grand Prix (engine, the only in race engine failure McLaren suffered all season), along with Senna's infamous accidents at Monaco (where he totally dominated qualifying and by lap 66 of the race had built a 50-second lead over Prost who had been stuck for 54 laps behind Berger, only to throw it away by crashing into the barriers at Portier. As he lived in Monaco, Senna went back to his home and did not contact the team until that night when he finally returned to the pits as the team was packing up, such was his disappointment), and Monza. Monaco was another example of McLaren's domination, Senna qualified 1.4 seconds faster than acknowledged Monaco master Prost, who himself was 1.2 seconds faster than third-placed Gerhard Berger in his Ferrari. The MP4/4 would be succeeded by the Honda V10 powered McLaren MP4/5 in 1989. Although statistically not as successful as the MP4/4 (more because others such as Ferrari, Williams and Benetton improved rather than McLaren and Honda faltered), the 1989 car would give the team another Constructors Championship, with Prost and Senna finishing 1-2 in the Drivers' Championship. To merge MP4 files, select multiple MP4 files in the Media Library while holding down Ctrl or Shift key, and then drag and drop to the video track on the Timeline. All MP4 files will be played one after another without a gap after saving to your computer. **Note:** at this stage, you have the merged video and audio in [vv] [aa] and you can either write them out to the final container, or use them in another filter to further process them! Within seconds of doing so, Windows Media Player will begin converting the MP4 file to another video format, and the converted file will be saved to the preferred location on your computer. It works with a lot of other different types of video and audio files, but if the MP4 file you are trying to open is an older or specialized format, QuickTime may not be able to open it. In this case, you have several options; the first is, you can download another video player such VLC or any other third-party solution that can easily play the video. You can also choose to convert the MP4 format to another format, one that QuickTime will not have any problems with. To convert the video though, you will need the services of a good video converting tool. We don't recommend online solutions as they may affect the quality of the video. Finally, if you don't want to download another video player or convert the video to another format, you can simply choose to transfer the video to a device that will readily play the file or drag the file to Google Chrome to open it on your browser. **Tip:** If you anticipate high traffic to your site, first publish your document in Google Docs, Sheets or Slides.
