

Apps Worth Buying

Apps Worth Buying

Kustom Industries is a developer on Google Play with a few great premium apps. The first is KWGT, a custom widget-maker where you can make widgets that do a variety of things. There is also KLWP, a custom live wallpaper maker for those who want that. Finally, you have KLCK, one of the last custom lock screen apps under active development. All three apps follow a similar premise. They let you create customized things for your phone with a no-nonsense WYSIWYG editor and simple enough instructions. Each app has a free version and a premium version for \$4.49 per app. Anyone looking for deeper customization and theming should check these apps out first. Nova Launcher is the gold standard for Android launcher apps. It features a modern UI, tons of extras, some theming features, and more. You can customize everything from the size of a home screen to the number of icons on the dock and plenty of other things. Tons of people already own this app, though. Thus, if you want to try something new, some other excellent premium apps include Hyperion Launcher, Action Launcher, and the new Apex Launcher. Textra is about as good as it gets for SMS apps. The theme is customizable in a bunch of different ways. It handles SMS and MMS very well. You can choose different emojis, there is support for video and GIF formats, and more. The app stays up to date on recent developments. For example, Android now supports message reactions and Textra already integrated it into the app. The app works smoothly and unobtrusively with very few issues. If we missed any great premium apps or paid apps for Android, tell us about them in the comments. You can also [click here](#) to check out our latest Android app and game lists.

Thank you for reading. Try these out too: There are a number of apps that I find worth purchasing, regardless of whether the payment is upfront or subscription based. The

biggest criteria for me is multi-platform support (iPhone, iPad, & Mac), a native app (vs electron **WHICH I LOATH**), whether or not the app takes advantage of the best features of iOS (i.e. drag & drop, side-by-side on iPad, etc...), and finally whether the app employs the iOS 11 design scheme, which I really like (but is a purely aesthetic and therefore subjective criterion). Going forward, appoLearning will focus on doing the same for iPhone applications, and developing other features to improve the experience, including the above-mentioned app search option, and plans to let end users curate their own app lists. The iPhone version is expected by early next year at the latest, but an Android version is not yet in the works given what the company has found to be a lack of quality educational apps and limited tablet market share for that platform. I have some Google Play credit to burn at this time, and am searching for an app to add to my Nexus 5's limited collection of applications. Since I'm not too into purchasing media/books, what are some apps that you think are worth the money, and for what reason? It can be anything, since I'm open to ideas. I've bought the occasional game, as well as productivity I related apps, but was curious what you all have spent money on so far. You may balk at the concept of paying for a dating app, but others certainly don't: Daters spent \$3 billion on apps(Opens in a new tab) in 2020, up 15 percent from the previous year. These days, singles aren't afraid to fork up cash for additional features on these apps, which were the most common way couples met(Opens in a new tab) each other for years before COVID. Bumble Premium is pricier than other dating app subscriptions. For comparison, a week's worth of Bumble Premium, \$19.99, is worth a month of Tinder Platinum. Hinge, meanwhile, is in the middle(Opens in a new tab) at \$29.99 per month. Anna Iovine is the sex and relationships reporter at Mashable, where she covers topics

ranging from dating apps to pelvic pain. Previously, she was a social editor at VICE and freelanced for publications such as Slate and the Columbia Journalism Review. Follow her on Twitter @annaroseiovine([Opens in a new tab](#)). This combination of hardware and software makes your Apple devices powerful enough to compete with dedicated drawing tools like the Wacom Cintiq. The iPad apps, combined with features built into the iPadOS software, save Apple users from a hefty investment into specialized hardware. Keeping professional artists out of unnecessary investments and allowing hobbyists to improve their craft by utilizing technology that they already own makes the Apple Pencil a worthwhile purchase for millions of iPad users. For high school and college students, leveraging the iPad with notetaking apps like Evernote, Microsoft OneNote ([comparison here!](#)) or any of the other great notetaking apps in the App Store can help learners capture detailed, handwritten notes, and organize their digital classwork. Taking a step in the opposite direction, apps like Showbie help teachers run a paperless classroom while the Apple Pencil allows them to mark up homework and grade quizzes without leafing through endless stacks of paper. Thanks to creative app developers and their initiatives in education, the Apple Pencil is worth buying for teachers and students who want the best tools possible for an efficient and immersive classroom experience. Tabbed browsing is so convenient that you might wish other apps on your computer had the feature too. That's where Groupy comes in---it's a straightforward Windows utility that brings tab grouping to all apps. Simply drag one app window on top of another to group them together. This lets you, for instance, keep tabs from multiple apps together when you're using them to work on one task. You can save tab groups to easily reopen later, as well as setting Groupy to always group multiple

instances of certain apps together. We've previously discussed how you might not need Microsoft Office, thanks to the wealth of free alternatives like LibreOffice and Office Online. And while that does hold true for many people, Microsoft 365 is worth paying for if you fall into the right use case. If you work with multiple monitors, you've probably noticed that Windows doesn't do a whole lot to let you customize them. DisplayFusion adds a ton of functionality in this area, making it well worth the cost if you want to optimize your screen real estate. Text expansion is a huge productivity booster that's worth the cost, and Breevy is a great choice for it. The app lets you set up shortcuts (such as "@@") that let you expand to a larger block of text (like your email address). This saves you a ton of time---you won't have to worry about repetitive blocks of text taking up your time anymore. We've talked before about how everyone should use a password manager to generate secure passwords and keep them safe. While some password managers are available for free, there are many paid password managers that are worth the few dollars per month. While it's one of the most expensive apps on the list, Grammarly is worthwhile for anyone who writes on their computer a lot. Whether you want to improve your papers for school or have a second set of eyes while you blog or work on a novel, it's a huge help. This is just a sample of the best paid software for Windows that's worth your time. There are many other apps worth checking out, such as screen recorders, screenshot tools, and creative apps. But what's worth buying in those categories depends on your individual needs, while we tried to focus on broadly applicable apps here. Every budgeting app is different, but they mostly work along the same lines to help you manage your money. These apps can sync with your bank and credit card accounts to help you keep track of spending and manage your financial life

virtually anywhere. The main function of these financial apps is to help you create a workable budget that you can stick to, based on your typical income and spending. Some apps use a specific budgeting approach, like the zero-based budget. Others take a more general approach, allowing you to create different budget categories and assign money from your paychecks to those categories. Using a budgeting app can help you stick to your budget and spending plan. The challenge is knowing how to use the app to your advantage. With that in mind, here are five reasons why budgeting apps can end up falling short: Let me say at the outset that we are big fans of Filmic Pro. For a one-time payment of \$14.99, it represents fantastic value for the tremendous functionality that it offers. Indeed, having tested all of the competitor apps that have come on the scene since Filmic Pro arrived, in our opinion, Filmic Pro still takes the top spot in terms of functionality and value. We have tested ALL of the major smartphone filmmaking apps including Protake, Moment, Mavis, MoviePro, ProMovie and FilmicPro. See our comparison chart by clicking the image on the right to find the right app for your needs. With Facebook Portal, you can connect to WhatsApp, Spotify, Netflix, Paramount+, Facebook, Instagram, Messenger, Prime Video, Pandora, iHeart Radio, Showtime, Food Network, Newsy, and more. Portal works with Zoom, and other video conferencing apps like GoToMeeting, Workplace, BlueJeans, and WebEx. Portal lets you open Messenger rooms as well, for large-scale calls of up to 50 people. To see all the listening options for Audible, [click here](#). The tl;dr; version of that page is that you can get apps for iPhone, Android, and Windows to begin with. But you can also listen in other ways, including on: A common argument against getting a Chromebook is that you can do so much more with a real computer -- i.e., a laptop running on MacOS, Windows or a Linux distro. This is generally

true, but again, many people don't need to do more. What can be done with web, Linux and Android apps on Chromebooks are increasingly more than enough to get through your day-to-day tasks. So many things, especially when it comes to productivity tasks like word processing and spreadsheets, can happen in a browser or with a web app. Web apps are essentially website bookmarks that look like mobile apps on a phone or tablet and Google has a web store full of them. More feature-rich web apps, called progressive web apps or PWAs, actually function like full mobile apps letting you do things like use them offline, store files locally and let you receive updates and notifications. Microsoft Office is available for Chromebooks as PWAs, for example.
